

Rhino Visual Tips 4.0

Layers

Learn how to organize your drawings with the help of layers.

Key things to remember.

There are many options for layers in Rhino 4.0. One of the best ones, and recently added is the possibility to make sub-layers. This is a great way to organize all your layers by groups. Also, pay attention to how you name your layers. It helps to make all the layers with color and line-types. Save them as a template so they can be used over and over again.

Rhino 4.0 layers work like CAD layering systems. By creating objects on different layers, you can edit and view related portions of a model separately or as a composite.

Notes: Find the status bar, and click the layer shortcut icon. You will see the layer pop-up. You can checkbox the name of any layer and set that layer as the current. Note also that you have to define the type of lines before you use them with the layer pop-up.
