

Rhino Visual Tips 4.0

Curves from objects.

Learn how to get curves and surfaces from other objects.

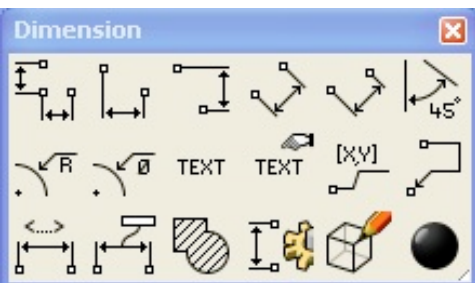

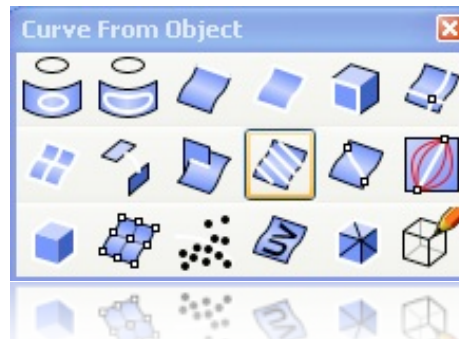

Key things to remember.

One of the best features of Rhino 4.0 is History. Now you will be able to Loft some curves, section the surface and edit the original curves that were used to create the loft. The change is instant!, since History will let you edit the original curves and see the change almost in real time.

Learn how to take advantage of history when you use some commands from the Curve From Object toolbar. Commands like Intersection and Project can be used with history.

Notes: Open the dimension toolbar. Inside that toolbar you will also find the command called Make 2D. You can find it by the black cube with the pencil. You can create a 2D drawing from a 3D model. This command is found in both toolbars, the Dimension and Curve from Objects.
